Power MOSFETs

All power MOSFETs have the following features:

- 1) No carrier storage effect
Superior frequency and switching characteristics
- 2) Rugged without current concentration
- 3) Low drive power due to voltage-controlling device
- 4) Easy parallel connection

Toshiba Power MOSFETs have the following additional features:

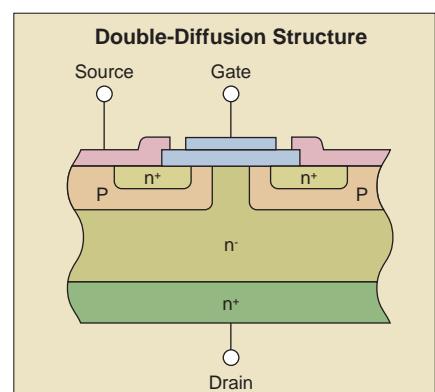

- | | |
|--|--|
| 1) Guaranteed avalanche withstand capability | ➤ No absorber circuit required |
| 2) Improved the function of built-in diodes | ➤ greatly expands the possibility of circuit design |
| 3) High ruggedness | ➤ enables to take better margin for circuit design |
| 4) High-speed switching | ➤ contributes to equipment's high-speed operation |
| 5) Low $R_{(DS)ON}$ | ➤ reduces power consumption of equipment |
| 6) Downsized packages | ➤ enable equipment's size to be compact and thin |
| 7) Low drive loss | ➤ reduces power consumption of equipment |
| 8) Zener diode between gate and source | ➤ Improved electrostatic withstand between gate and source |

Structure of Toshiba Power MOSFETs

● π-MOS

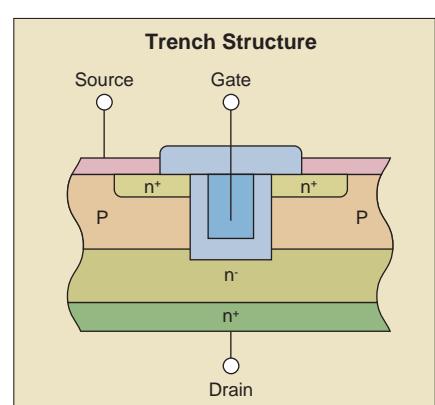

Toshiba Power MOSFETs use the double-diffusion MOS (D-MOS) structure, which produces a high-withstand voltage, to form channels. This structure is especially well suited to high-withstand voltage and high-current devices.

A high level of integration yields a high-performance power MOSFET with low On-resistance and low power loss.

● U-MOS

Higher channel density is achieved by connecting channel vertically as having a U-groove at the gate region and this structure reduces On-resistance to lower than other MOSFET structures. This is an ideal for low-voltage power MOSFETs.

2 New Power MOSFET Products

New Power MOSFET Products

All products have a protection zener diode between gate and source.

Avalanche withstand capability in single and series Power MOSFET products

SOP Series $V_{DSS} = 20\text{ V to }60\text{ V}$

SOP Series products are compact and thin, and require only a small mounting area. They are suitable for lithium-ion secondary battery protection circuits and for notebook PCs.

- Applications
- Lithium-ion secondary battery protection circuits
 - Notebook PCs
 - Portable electronic devices

VS and PS Series $V_{DSS} = 12\text{ to }30\text{ V}$

VS Series and PS Series products are very compact and thin, and suitable for various items of portable electronic devices.

- Applications
- Portable phones
 - Notebook PCs
 - Portable electronic devices

TFP (Thin Flat Package) Series

TFP (Thin Flat Package) Series is comprised of new high-performance devices with a 4-pin structure for separating input and output. TFP Series devices have the same ratings as existing TO-220SM package devices; however, the volume of them occupies only 42% of the volume of TO-220SM package devices.

- Applications
- DC-DC converters
 - PDP drivers
 - Motor drivers

TO-220SIS Series $V_{DSS} = 450\text{ to }900\text{ V}$

This series downsized 2.8-mm package height compared to the conventional package, TO220NIS. In addition, the chip design optimization, π -MOS IV / VI Series housed in this new package, reduced Qg characteristics.

- Applications
- DC-DC converters
 - Motor drives
 - Switching power supplies
 - AC adapters

U-MOS III Series $V_{DSS} = 40\text{ V to }100\text{ V}$

High-integration is achieved using trench structure technique. Low-voltage driving ($V_{GS} = 4\text{ V}$) is possible because of ultra-low On-resistance.

- Applications
- DC-DC converters
 - Motor drives
 - Solenoids and lamp drives

π -MOS VII Series $V_{DSS} = 100\text{ V}$

With employing submicron technology and reducing gate charge, this latest series realized extremely fast speed and low $R_{DS(ON)}$.

- Applications
- Digital amps
 - DC-DC converters
 - Motor drivers

π -MOS V Series $V_{DSS} = 150\text{ V to }250\text{ V}$

The π -MOS Series is comprised of low-cost devices which are ideal for use in monitors, especially for frequency control and S-shape correction.

- Applications
- Monitors
 - DC-DC converters
 - PDP drives

π -MOS V High-Speed Series $V_{DSS} = 250\text{ V to }600\text{ V}$

π -MOS V High-Speed Series is new product series and achieves faster switching speed than π -MOS V Series which are currently well-established in the marketplace.

Two types of series are available:
High-Speed Switching Series
High-Speed Diode Series

- Applications
- Inverters
 - Motor drives
 - AC adapters
 - Switching power supplies

π -MOS V Series $V_{DSS} = 400\text{ V to }600\text{ V}$

This Series is comprised of highly integrated, high-performance, high-breakdown-voltage and low-cost products with V_{DSS} in the range 400 V to 600 V which are ideal for use in 100-V AC input-switching power supplies.

- Applications
- Switching power supplies
 - AC adapters
 - Lighting inverters

π -MOS III Series $V_{DSS} = 800\text{ V to }900\text{ V}$

This Series is comprised of highly integrated, high-performance, high-breakdown-voltage and low-cost products with V_{DSS} in the range 800 V to 900 V which are ideal for use in 200-V AC input-switching power supplies.

- Applications
- Switching power supplies

4 Power MOSFET Characteristics

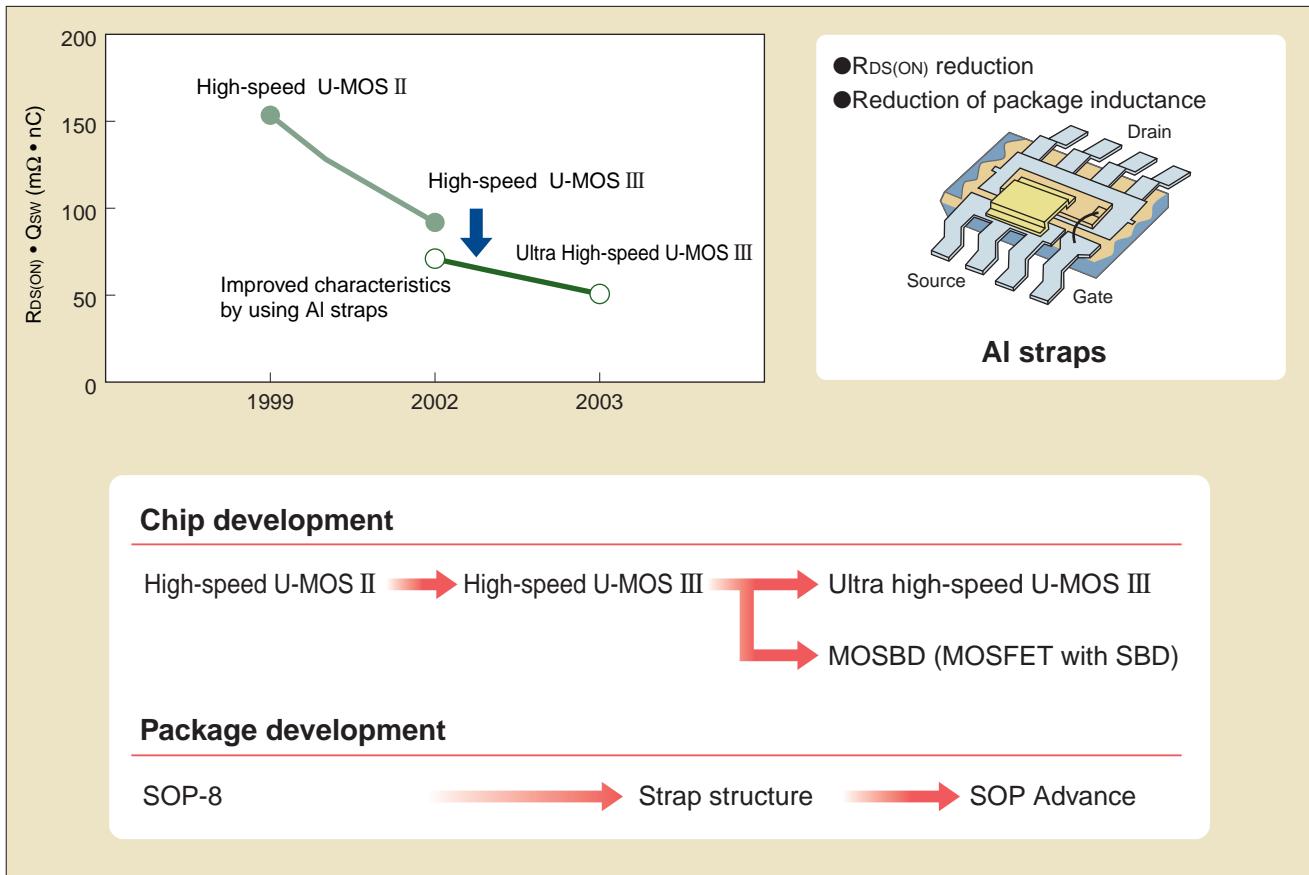

1. Features of SOP Series

① Circuit example for DC-DC Converter

② Development Process of High-Speed U-MOS Series

Improved trade-off between On-resistance and gate switch charge due to short-channel structure, trench contact structure and Al straps.

③ Ultra High-Speed U-MOS III Series

NEW

■ Characteristics

- Low gate switch charge: 14% reduction compared to high-speed U-MOS III
- Low On-resistance (Al straps): 34% reduction compared to high-speed U-MOS III
- Housed in SOP Advance, high current, thin and excellent heat dissipated package

► **43% R_{Ds(ON)} X Q_{sw} reduction**
(compared to high-speed U-MOS III)

4 Power MOSFET Characteristics

④ MOSBD (MOSFET with SBD)

NEW

■ Characteristics

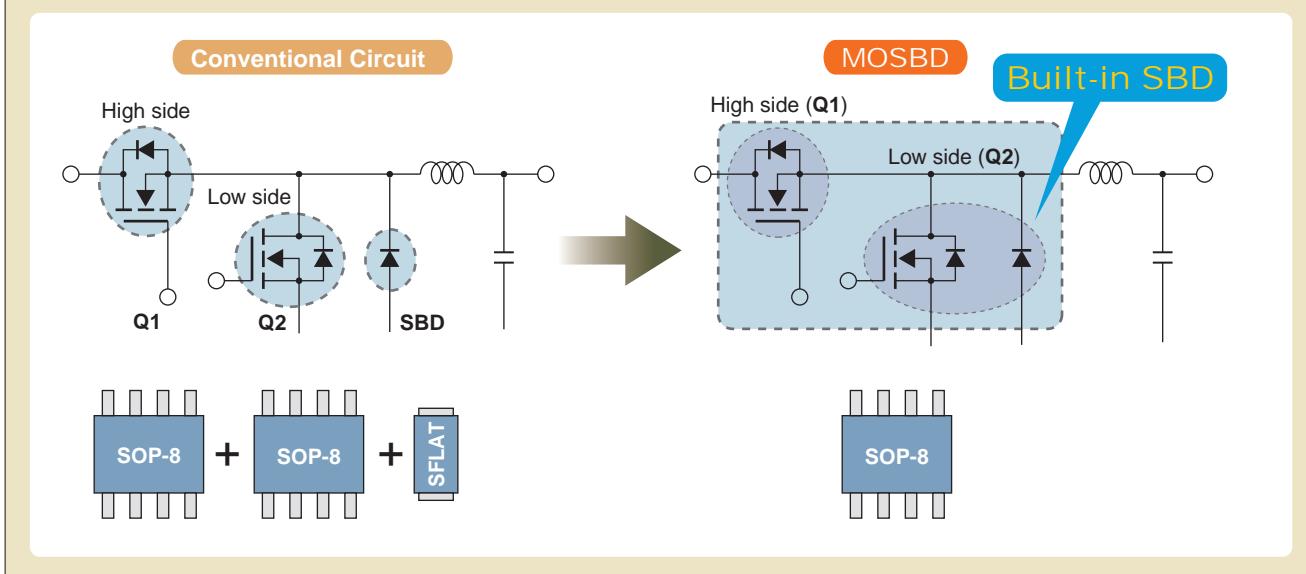

- Compact size

Integrated three devices (two MOSFETs and one SBD) into a single package

- High-performance device

High side: high-speed MOSFET (high-speed U-MOS III)

Low side: MOSBD (U-MOS III MOSFET with a SBD)

■ Applications

- Portable devices: DC-DC converters for notebook PCs

⑤ SOP Advance

NEW

■ Characteristics

- Mounting area is identical with that of SOP-8.
- On-resistance reduction and thin package (1.0 mm max) employing flat leads and Al straps
- Achieved high current and high power dissipation by attaching an exposed heat sink on the bottom of the package
($I_{D(DC)} = 40 \text{ A}$, $P_D = 45 \text{ W}$)

⑦ TSSOP-8 Series Features

■ Features

- Achieved $R_{DS(ON)} = 17\text{m}\Omega$ for TPCS8204 employing U-MOS III design
- Common-drain types are available:
Ideal use for lithium-ion battery protection and reverse current prevention

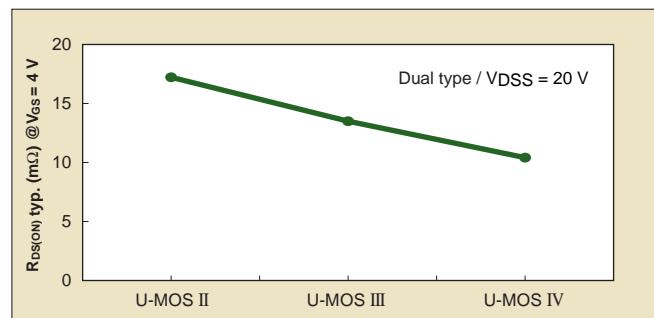

Low On-resistance

★ N-channel 20-V device (TSSOP-8 / dual type)

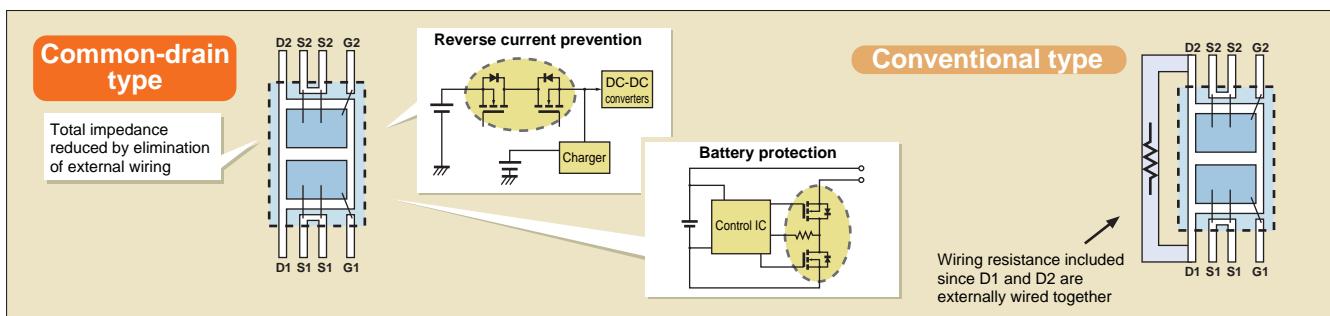

■ Characteristics

- Employed the third generation design of ultra-high cell density trench technology ($18 \text{ Mcell}/\text{cm}^2$)
- Reduced On-resistance by 25% than that of conventional products (in comparison with Toshiba U-MOS II device)

Common-drain Type

★ Common-drain series suitable for reverse current prevention in mobile devices and lithium ion secondary battery protection

4 Power MOSFET Characteristics

2. VS Series

■ Package

★ The VS Series that achieves the one of the industries' thinnest class package (height: 0.85 mm max).

- VS-6 Series: Standard size (2.9 mm x 1.6 mm) that is suitable for general-purpose use.
- VS-8 Series: The flat package offers more powers as compared with the VS-6 package, and the On-resistance is reduced by 20% while the mounting area is reduced by 32%. In addition, the power dissipation is improved by 14%.
- PS-8 Series: Achieving the same mounting area as the VS-6 Series, PS-8 is improved chip mounting capability, widen mold width using flat leads. This Series is also reduced the On-resistance by 70%.

■ Main Applications

● **DC-DC converters:** notebook PCs, LCDs, PPDAs

● **Switches:** Cell phones, notebook PCs, USB switches, power management switches

● **Motor drives:** HDDs

① VS-6 Series Line-up [Part Number: TPC6xxx]

■ Features

- Achieved ultra low-On resistance employing U-MOS II design
- Zener diode between gate and source for all products
- Thin package whose height is as low as 0.85 mm (max) on a board.

3. TFP (Thin Flat Package) Series

■ Features

TFP ----- Stands for Thin Flat Package

- Thin flat package has a mounting volume 58% less than that of the TO-220SM.
- Separate package inputs and outputs enable stable equipment operation.
- Improved heat dissipation characteristic enables mounting of higher-power devices.

Package range for surface-mount devices

■ Applications

■ DC-DC converters

■ Motherboards

■ Automotive equipment

3-1. Heat Dissipation Characteristic

Thermal resistance TFP with mounting area 33% less than that of the TO-220SM offers R_{th} (ch-c) and R_{th} (ch-a) almost equivalent to those of the TO-220SM (when mounted on an HIT board).

Application of DC current (with infinite heat dissipation heat sink mounted)

The source fin of the TFP generates less heat than the source lead of the TO-220SM due to the TFP'S efficient heat dissipation.

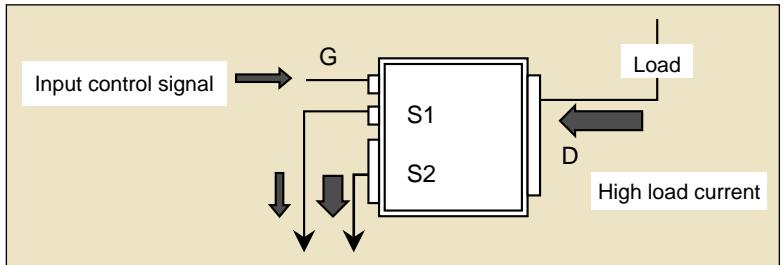

4 Power MOSFET Characteristics

3-2. For Stable Circuit Operation and High-current, High-speed Switching

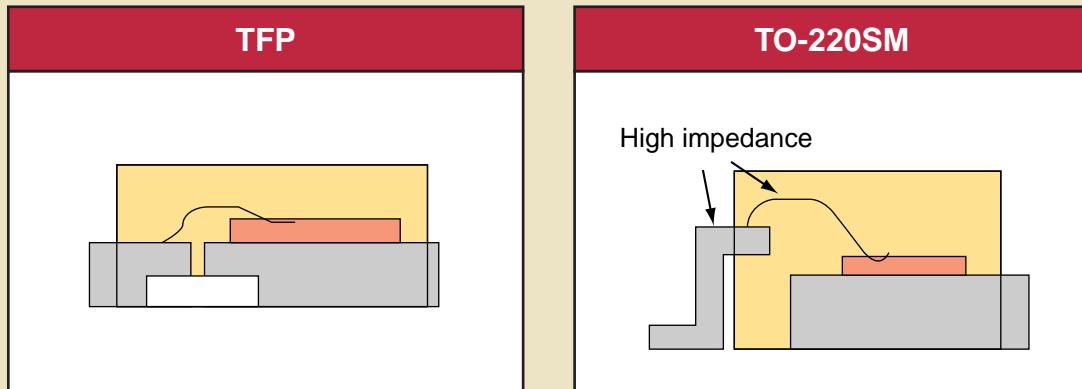

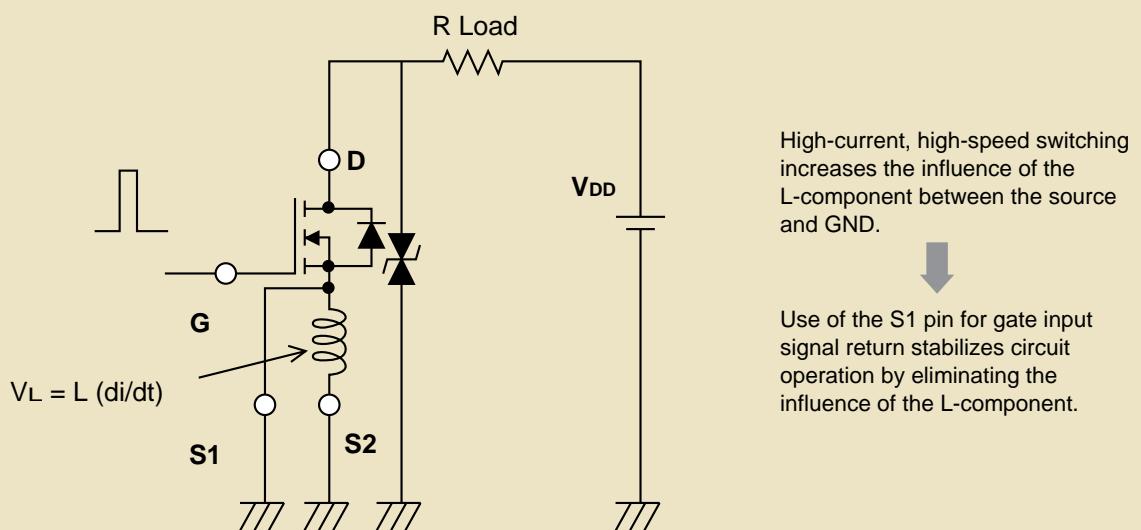

Stable circuit operation

The advantage of MOSFETs is that, because of their high input impedance, they allow high output control with low power drive. However, their disadvantage is that they are susceptible to malfunction due to noise. TFP Series devices have four pins, allowing the input drive to be kept separate from the outputs, thus reducing the risk that the outputs will affect the input.

L-component influence on high-current, high-speed switching

Lead impedance, which causes problems with high-current, high-speed switching in DC/DC converters, is reduced.

Switching waveform

The four-pin structure results in a shorter rise time and more stable switching, all of which help to reduce the risk of abnormal oscillation.

When the S1 pin is not used for input signal return (3 pins):

$t_r = 5.4 \text{ ns}$, $t_{on} = 25.1 \text{ ns}$
 $V_{DS} = 10 \text{ V}$, $I_{DS(on)} = 40\%$

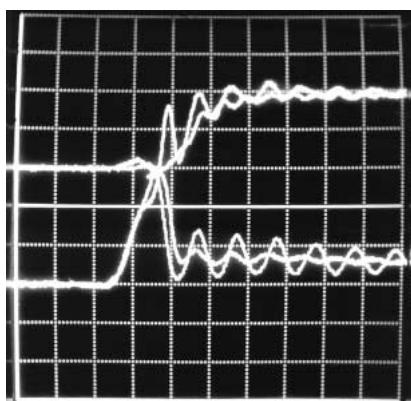

Shorter rise time

Stable circuit operation

When the S1 pin is used for input signal return (4 pins):

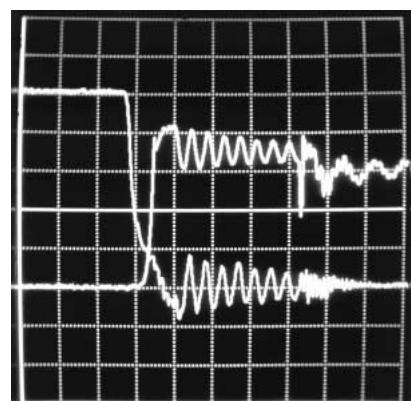

$t_r = 4.6 \text{ ns}$, $t_{on} = 22.1 \text{ ns}$

3-pin, 4-pin

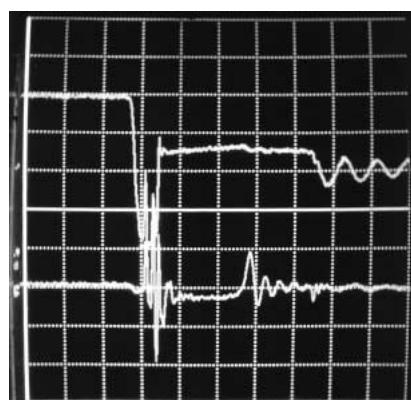

$V_{GS} = 2V/\text{div}$, $V_{DS} = 5V/\text{div}$, $t_W = 20\text{ns}/\text{div}$

4-pin

$V_{GS} = 2V/\text{div}$, $V_{DS} = 5V/\text{div}$, $t_W = 100\text{ns}/\text{div}$

3-pin

$V_{GS} = 2V/\text{div}$, $V_{DS} = 5V/\text{div}$, $t_W = 100\text{ns}/\text{div}$

Insert a coil of $L = 17 \text{ nH}$ between gate and source

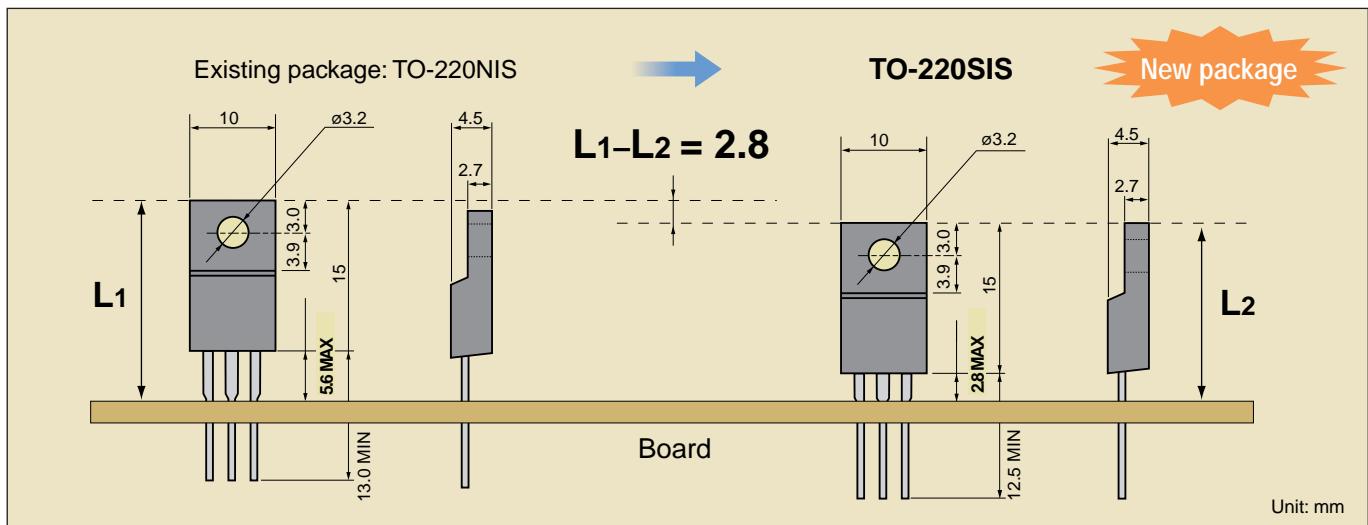

4 Power MOSFET Characteristics

4. TO-220SIS π -MOS IV / VI Series

■ Features

- The shorter the standoff height is achieved, the lower the product height on a PCB will be; hence, the mounting height is reduced by approximately 2.8 mm as compared to the existing package, TO-220NIS. This contributes to equipment's size reduction thinner size.
- The chip design optimization reduced Qg characteristics. Also, the switching characteristics realized 10%-faster than that of existing products.
- Improved heat dissipation by employing a Cu connector.

4 Power MOSFET Characteristics

7. U-MOS III (Trench Type) Series

High-integration is achieved using trench structure technique. Low-voltage driving ($V_{GS} = 4V$) is possible because of ultra-low On-resistance.

■ Features

- High density by the submicron technology (phase I = 10 M cell / inch², phase II = 30 M cell / inch²)
- Reduces 60% $R_{DS(ON)}$ by per unit area (as compared to the maximum $R_{DS(ON)}$ of the conventional L²- π -MOS V)
- Possible to operate by logic level voltage ($V_{GS} = 4 V$)
- Avalanche withstand capability guarantee and progress in di/dt capability.
- Protection zener diode between gate and source

• Operate with logic level voltage ($V_{GS} = 4 V$)

8. π -MOS VII Series

With employing submicron technology and reducing gate charge, this latest series realized extremely fast speed and low RDS(ON).

■ Features

- Low RDS(ON)
- Total gate charge (Q_g) reduction
- Fast speed switching
- High avalanche withstand capability

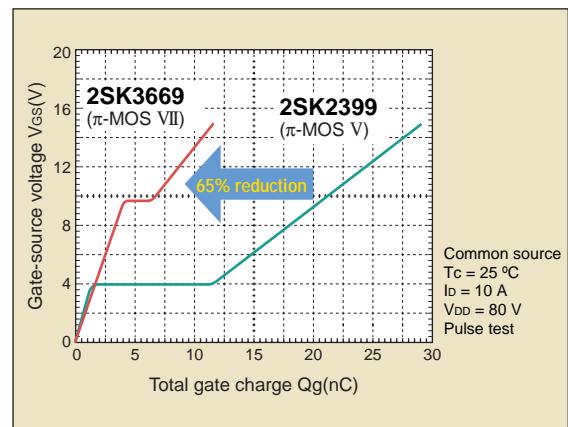

■ Applications

- Digital amps
- DC-DC converters
- Motor drives

9. π -MOS V Series ($V_{DSS} = 150$ V to 250 V)

200-V Series for Cs / Cy switching in monitors

■ Features

- Reduced On-resistance per unit area
- Chip size smaller than conventional chips and device cost reduced
- Superior breakdown voltage characteristics due to optimized cell structure
- Guaranteed absolute maximum voltage rating between gate and source: $V_{GSS} = \pm 20$ V
- Products with V_{DSS} of 200 suitable for resonance capacitance (Cs/Cy)

10. π -MOS V Series ($V_{DSS} = 400$ V to 700 V)

High-performance series for 100-V AC input-switching power supplies

■ Features

- Low-drive-power, high-speed (Q_g reduced by 40%, t_f by 30%)
- Guaranteed $V_{GSS} = \pm 30$ V for every device in product line
- Avalanche withstand capability guaranteed, superior withstand capability of parasitic diode
- Protection zener diode between gate and source

4 Power MOSFET Characteristics

11. High-Speed π -MOS V Series ($V_{DSS} = 450$ V to 600 V)

To allow the development of high-efficiency portable equipment, Toshiba has developed two Series of high-speed Power MOSFET devices. The two series are as follows:

The High-Speed Switching Series for AC adapters and switching power supplies

The High-Speed Switching Series for motor controllers and inverter circuits

- High-Speed Switching Series: Achieves faster switching speed than the existing π -MOS V Series which are currently well-established in the marketplace (t_{off} -switching is 38% faster).
- High-Speed Diode Series: Achieves faster parasitic diode speed by using lifetime control ($t_{rr} \doteq 100$ ns).

■ Features of MACH Series

Switching loss reduced by 40%

■ Characteristics of high-speed diode series

Faster parasitic diode

12. π -MOS III Series ($V_{DSS} = 800$ V to 1000 V)

High-performance, high-speed devices for 200-V AC input-switching power supplies

■ Features

- Low drive-power, high-speed devices (Qg reduced by 60%, t_f reduced by 25%)
- Guaranteed V_{GSS} = ±30 V.
- Avalanche withstand capability guaranteed, superior withstand capability of parasitic diode
- Protection zener diode between gate and source

1. Compact Surface-Mount Packages

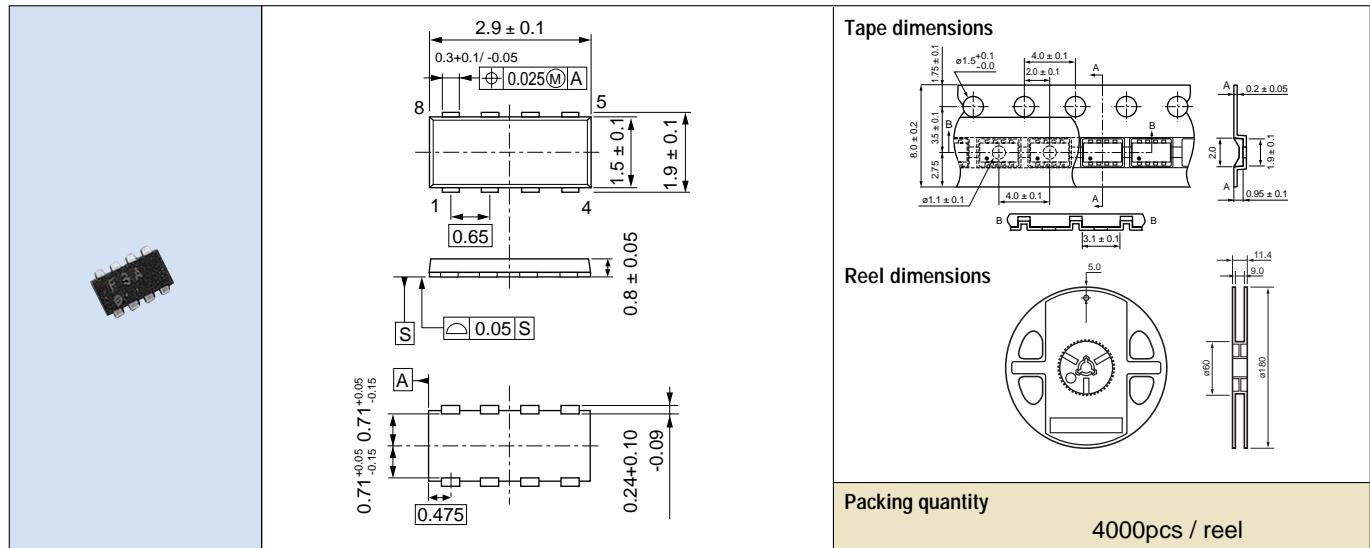

To meet requirements for compact and thin equipment, Toshiba offers various packages with power dissipation of 1.0 to 150 W and drain current of 1 to 50 A. In addition, we offer devices housed in the SOP-8 and TSSOP-8 packages. These devices consist of input/output isolated TFP Series MOSFETs and trench MOSFETs with ultra-low ON-resistance.

The information contained herein is subject to change without notice. 021023_D

The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others. 021023_C

TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc. 021023_A

The Toshiba products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These Toshiba products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc. Unintended Usage of Toshiba products listed in this document shall be made at the customer's own risk. 021023_B

TOSHIBA products should not be embedded to the downstream products which are prohibited to be produced and sold, under any law and regulations. 030519_Q
